

300 US-1, Cheraw, SC 29520 USA.

Screening Test/Interview Questions for Frontend Developer (Remote) Position

Instructions: Please precede all your answers with the question you are answering. Use acronyms only after you've explained them.
Use correct spelling and grammar.
Be sure to write your name and the interviewer's name.

Candidate's Name: Omnia Abouhassan

Interviewer's Name: Martin Wheeler

- Are you currently employed? Yes, I am currently engaged in professional and personal development in frontend technologies, and I am actively seeking a role where I can contribute meaningfully while continuing to grow.
- Can you work 30 to 40 hours for the company? Yes, I am available and fully committed to working 30 to 40 hours per week and can adapt to the company's scheduling needs.
- What is the difference between HTML and CSS? HTML (HyperText Markup Language) is used to structure content on a webpage, such as headings, paragraphs, images, and links. CSS (Cascading Style Sheets) is used to control the presentation and layout of that content, including colors, spacing, alignment, and responsiveness.
- How do you structure your HTML documents? I follow a clean and semantic structure using HTML5 standards. This includes organizing content with meaningful elements such as `<header>`, `<main>`, `<section>`, `<article>`, and `<footer>`. I also ensure accessibility by using proper tags, alt attributes for images, and logical content hierarchy.

- What is the box model in CSS? The CSS box model describes how elements are displayed and spaced. It consists of four parts: content, padding, border, and margin. Understanding this helps control layout, spacing, and alignment across a webpage.

- How do you center an element horizontally and vertically using CSS?

```
.container {  
  
    display: flex;  
  
    justify-content: center; /* horizontal */  
  
    align-items: center;      /* vertical */  
  
    height: 100vh;  
  
}
```

- What is JavaScript and how is it used in frontend development? JavaScript is a programming language used to create dynamic and interactive web experiences. In frontend development, it is used to handle user interactions, manipulate the DOM (Document Object Model), fetch data from APIs (Application Programming Interfaces), and update content without reloading the page.

- Can you explain the concept of scope and closure in JavaScript? Scope refers to where variables are accessible within the code, such as local or global scope. A closure occurs when a function remembers variables from its outer scope even after that outer function has finished executing. Closures are useful for data encapsulation and maintaining state.

- Can you explain the concept of a component in React? In React, a component is a reusable, self-contained piece of UI (User Interface). Components can manage their own logic and state, and they can be composed together to build complex applications. This modular approach improves maintainability and scalability.

- How do you handle state changes in a React application? State changes are handled using hooks such as `useState` or `useReducer`. When state changes, React re-renders the component efficiently. I also follow best practices like immutability and lifting state up when necessary to maintain consistency across components.

- Can you explain the concept of responsive design? Responsive design ensures that a website

adapts to different screen sizes and devices. This is achieved using flexible layouts, media queries, and relative units (like percentages or rem). The goal is to provide a consistent and usable experience across desktops, tablets, and mobile devices.

- Can you explain the difference between ARIA attributes and semantic HTML?

Semantic HTML uses meaningful elements (like `<button>`, `<nav>`) to provide built-in accessibility. ARIA (Accessible Rich Internet Applications) attributes are used to enhance accessibility when semantic HTML alone is not sufficient, such as in complex dynamic interfaces. Ideally, semantic HTML is used first, with ARIA as a supplement.

- Can you explain the concept of unit testing in JavaScript? Unit testing involves testing individual parts of a program to ensure they work correctly in isolation. In JavaScript, tools like Jest are commonly used to test functions, components, and logic to prevent regressions and improve code reliability.

- How do you debug JavaScript errors? I use browser developer tools, especially the console, breakpoints, and network tab. I also utilize logging, error messages, and step-by-step debugging to isolate issues. In addition, I review stack traces and test edge cases to ensure stability.

- Can you explain the concept of a testing framework? A testing framework provides structure and tools for writing and running tests. It typically includes utilities for assertions, mocking, and test execution. Examples include Jest and Mocha, which help ensure consistent and automated testing processes.

- How do you handle feedback or criticism on your code? I view feedback as an opportunity to improve and grow. I listen carefully, ask clarifying questions if needed, and apply suggestions where appropriate. I also appreciate collaborative reviews, as they improve both code quality and team communication.

- Can you describe a time when you had to learn a new technology or skill quickly? A recent example was when I needed to deepen my understanding of React hooks and

state management in a short time. I dedicated focused time to documentation, practical exercises, and building small projects, which allowed me to quickly become comfortable applying those concepts in real scenarios.

- What is your experience with React, Angular, or Vue? I have hands-on experience with React, including building components, managing state with hooks, and integrating APIs. I am also familiar with the concepts behind Angular and Vue, such as component-based architecture and reactive data binding, and I am comfortable adapting to different frameworks as needed.

- Can you write an HTML and CSS snippet that creates a responsive navigation menu?

```
<nav class="navbar"><navdiv class="logo">MySite</div>
```

```
<ul class="nav-links">
```

```
<li><a href="#">Home</a></li>
```

```
<li><a href="#">About</a></li>
```

```
<li><a href="#">Services</a></li>
```

```
<li><a href="#">Contact</a></li>
```

```
</ul>
```

```
</nav>
```

```
.navbar {
```

```
  justify-content: space-between; display: flex;
```

```
  align-items: center;
```

```
  background: #333;
```

```
  padding: 10px 20px;
```

```
    color: white;
}
```

```
.nav-links {
    display: flex;
    list-style: none;
    gap: 15px;
}
```

```
.nav-links a {
    color: white;
    text-decoration: none;
}
```

```
@media (max-width: 768px) {
    .nav-links {
        flex-direction: column;
        display: none;
    }
}
```

- How much will you require per hour if you are being hired for this position? Based on my current skill level and market standards, I would expect a rate in the range of **\$35–\$55 per hour**, though I am open to discussion depending on the overall compensation package and role expectations.

- When can you start working for the company?

I am available to start immediately and can adjust quickly to onboarding requirements.

DUTIES:

Key Responsibilities:

Build and maintain web and iOS applications using technologies such as React.js, Swift, and modern JavaScript frameworks (e.g., Angular, Vue.js).

Ensure responsive, user-friendly design and seamless cross-browser and cross-platform functionality. Work with backend teams to integrate and maintain systems for end-to-end functionality. Dive into source code to troubleshoot and resolve issues independently.

Identify and address bugs, ensuring high reliability and performance of applications. Work closely with internal teams and external developers to align on technical requirements and deliverables.

Communicate effectively to ensure project goals are met and solutions are implemented efficiently. Contribute to Agile practices, including sprint planning, daily standups, and retrospectives. Ensure timely and high-quality delivery of front-end features and updates.

Requirements:

Strong proficiency in front-end development using React.js, and modern JavaScript frameworks. Knowledge of HTML5, CSS3, responsive design principles, and UI/UX wireframing. Python knowledge is a plus.

iOS / Swift experience preferred.

Proven ability to troubleshoot and debug source code independently.

Familiarity with cross-browser and cross-platform development.

Experience working with backend teams and integrating APIs; PHP knowledge is a plus.

Strong communication skills and ability to collaborate with global teams.

A proactive, problem-solving mindset and the ability to work independently.

Preferred Skills:

Experience in automated testing and debugging techniques.

Familiarity with Agile development practices such as Scrum or Kanban.

Salary range: \$69,000 to \$160,000.

Benefits:

401(k), 401(k) matching, Dental insurance, Employee assistance program, Employee discount, Health insurance, Health savings account, Life insurance, Paid time off, Referral program, Vision insurance, Sign On Bonus.

Can you handle all of these duties effectively? Yes, I am confident in my ability to handle these responsibilities. I am comfortable working independently, collaborating with teams, troubleshooting issues, and delivering responsive, user-friendly applications. I am also highly motivated to continue learning and contributing to the team's success.
